

MediaStar Wired IR Sensor for 780/782 Media Players (911-4154)

Key Features for

- IR sensor fitted with 2.0M cable
- 3.5mm 4 pole jack plug
- Cable entry option
- IR signal indicator LED

The MediaStar Wired IR Sensor is a discrete capsule with attached cable and connector containing an IR receiver and LED indicator to give remote IR capabilities to MediaStar 780 and 782 Media Players.

All 780 and 782 series Media Players have an integrated IR receiver built into the front of the units. If the Media Player is to be positioned out of sight, perhaps mounted behind a display or in a cabinet where line of sight is obstructed, then a MediaStar Wired IR Sensor is required.

The sensor can be discretely mounted adjacent to or on the screen bezel using the adhesive pad supplied and then connected to the unit. This action disables the unit's internal "on board" IR sensor.

The sensor cable can be adjusted for side or end entry as convenient. When the sensor unit receives an RCU IR command, a LED on the unit will flash. If the LED flashes without a RCU key press, the IR receiver is seeing signals from another source and should be repositioned to minimise this interference.

Model options: 911-4154-C, 911-4154-P
